January 6th is Epiphany, or Little Christmas. But you might also want to celebrate it a little like Halloween, if you happen to be in DC: (www.urmesurveillance.com)

4 Gotta cover the ears, man. Very strong mapping point. Also, I don't mean to sound like the paranoid, cynical bastard that I am, but assume that you CAN be tracked, if someone has reason to put in the time and effort. DC is likely covered in cameras. Don't think that they'll be obvious. Twenty years ago, I was building covert systems into all sorts of office equipment. As for regular cameras? No idea how many there are, but as an example, in the mid-2000's, the Lincoln Tunnel outside of NYC had 109 cameras alone.

3 Finally someone gets it. I can get an 80% confidence match just with a photo of someone's ear using aws rekegnition

3 I have pyvision with the facial recognition libraries running on my 1080p raspian security cameras. They recognize me with a hat and neck gaiter on as long as they can see markers around my eyes. Fun stuff to play around with but assume the government has something that costs 100x more and is at least twice as good.

3 Exactly.

Any amateur script kiddie can build a database for facial recognition and deploy it on cheap hardware now. Our faces are being scanned 10s of times every time we leave our homes. The bigger the city, the more you are getting scanned.

3 ▼ I do not. I'm only familiar with rekognition, and running interesting tests through google image search.

I once ran a piece of cake through google image search, and it was able to ascertain that it had butter cream frosting. George Orwell didn't even scratch the tip of the iceberg.

1 ▼ I didn't want to be a "downer", but I don't want people walking into this thing thinking they'll just do it and go back to their regular lives the next day. The reason the cops haven't ID'd and grabbed most of the antifa/blm terrorists is because they've been ordered not to - not because the software couldn't match those idiots. I already assume that I'm going to be ID'd, tracked and matched to a license plate no matter where I stash the car. Once upon a time, I was more prepared for this sort of thing, but I've turned into a pretty soft bitch over the last 15-20 years.

1 ▼ New York state now has tollboothless highways. You drive under, and it takes a picture of you, your car, and your license plate. If you have ez pass it bills you, and if you don't, it fines you! Things are beyond out of control.

1 ▼ Yeah, I talked to some of these guys in the late '90s when they were in the planning stages. They were going to have you wave a proximity card at a reader (like how you get into a building). That was before the EZPass system really took off. Of course, I only thought that stuff was really cool technology at the time. Never realized where this country was headed. Innocent young country-boy, back then. **Got off the subject - assume the major highways and exits will be blocked or monitored. You're looking at two-lane roads and local entrances if you want to increase your chances.

1 ▼ A small rock under the insole of one shoe is brought to disrupt gait

2 ▼ Nah, that can be compensated for pretty easily. Also doesn't stop you from being tracked automatically even if you're not identified.

masked datasets that are available that's not really effective anymore for cameras.

Additionally, nothing like this should give anyone a false sense of security. You can still be tracked and traced based on many other characteristics. Gait recognition is a big one that is not considered by many people. Obviously clothing is another one and normal object tracking through surveillance networks is also a readily available and largely automated utility for large implementations. Meaning you commit a crime or they want to ID you and can scroll back through all the security footage until they hit you getting out of your car etc.
